## Kanguru e-Flash (eSATA +USB Flash Drive)

KEFL SERIES

[Overview](#) | [Specifications](#) | [Product Registration](#) | [Warranty](#) | [Support](#)

### Description

Get lightning fast performance with the Kanguru e-Flash, the first flash drive to feature eSATA (External Serial ATA) connectivity. In addition to eSATA, the Kanguru e-Flash also contains a USB2.0 connection for universal connectivity to virtually any computer.

No application or data file is too large for the Kanguru e-Flash to handle! With 32GB of storage and the fastest external connection available, the Kanguru e-Flash is a pocket sized workhorse!

One end supports high speed, powered eSATA (3Gb/s connectivity, 5 times faster than a standard USB 2.0 drive) and the other end supports USB 2.0. The ultra-fast transfer speed, high capacity and small size makes it a great replacement for a bulky external Hard Drive.

The e-Flash's Power Over eSATA interface allows it to be connected to a powered eSATA port, eliminating the need for an external power supply. The included Power + eSATA bracket is installed on your desktop computer and provides you with a powered eSATA port for use with the Kanguru eFlash. Additional Power + eSATA brackets can be purchased separately for installation on all your desktop computers or a Power + eSATA ExpressCard is available for laptop users at an additional cost. Several new laptop models come with a USB/eSATA combo port which can also be used as a powered eSATA port.
